

Produce high definition labels from your choice of printing process

To complement our existing UVivid inks, Fujifilm Sericol now offers letterpress and offset inks for narrow web printers

When we launched our UVivid JD ink range it set new standards in high definition UV flexo printing. Our customers achieved print results previously unattainable with flexographic technologies.

Now printers who use letterpress and offset for their narrow web projects can achieve the same high definition results with the introduction of the UVivid LP and UVivid OU inks to the UVivid range.

These new inks give you the high definition label results you're after combined with compatibility with your printing process.

However, it goes without saying that we support all our UVivid inks with 30 years of UV experience, Australia-wide delivery and expert technical assistance.

To support our inks, a range of narrow web ancillary products are also available, including Alpha-Cure UV lamps, 3M Easy Mount mounting tape and Sandon anilox, as well as our exclusive Pantone® colour management system.

You could say we now offer the total package when it comes to narrow web printing.

SERICOL
More than ink... Solutions.
